

Introduction

welcome back I'm Berard M author of over

20 bestselling books on future Trends including generative AI in practice and AI strategy today I'm sharing how to create an AI governance framework that actually works not theoretical Concepts but practical approaches that I've seen succeed in real organizations let's start with a

A sobering reality

sobering reality a financial services company I advise had to shut down their jackbot after it started sharing confidential information they had great technology but poor governance this is a common story and it's completely avoidable a good AI governance framework has five key pillars ethics risk management accountability transparency and compliance but here's what matters how to implement them practically first establish your AI

Establish your AI ethics council

ethics Council this isn't just a committee that meets quarterly One tech company I work with has their ethics Council review every AI projects at three stages planning testing and deployment they use a clear checklist for ethical considerations making it practical rather than philosophical second create your risk

Create your risk assessment framework

assessment framework I advised an energy company that uses a simple but effective three tier system low medium and highrisk AI applications each tier has specific governance requirements and review processes this makes risk management clear and actionable third

Define clear accountability structures

Define clear accountability structures

who can approve AI projects who monitors them who's responsible when things go wrong I've work with a retail company that creates AI ownership cards for each project clearly stating responsibility from development to deployment fourth

Implement transparency protocols

Implement transparency protocols this isn't just about explaining AI decisions it's about documenting every aspect of your AI system a manufacturing company I work with maintains what they call an AI passport for every system tracking its training data decision logic and performance metrics here's a practical

Practical implementation approach

implementation approach start with a governance pilot in one Department create clear documentation templates establish regular review cycles and build feedback loops for continuous Improvement remember governance isn't about creating obstacles it's about enabling safe and effective AI use one company reduced their AI incident rate by 80% while actually speeding up their deployment processes through clear governance structures common pitfalls to

Common pitfalls

avoid making governance too complex failing to involve key stakeholders not updating governance as AI evolves focusing on rules rather than outcomes the future of AI governance is adaptive as AI systems become more autonomous your governance framework needs to evolve Forward Thinking organizations are already building flexibility into their Frameworks
